HYDROLOGIC SERVICES PROGRAM MANAGEMENT

NOTICE: This publication is available at: <http://www.nws.noaa.gov/directives/>

OPR: OS31 (T. Helble)
Type of Issuance: Initial

Certified by: OS3 (G. Austin)

SUMMARY OF REVISIONS: This directive supersedes WSOM Chapter E-01, “Hydrologic Service Program,” Issuance 89-6, dated August 1, 1989; WSOM Chapter E-02, “Hydrologic Program Management,” Issuance 80-15, dated September 4, 1980; and OML 74-8, “Management of Flash Flood Program,” dated March 21, 1974.

<u>Signed</u>	<u>September 17, 2002</u>
Gregory A. Mandt	Date
Director, Office of Climate, Water, and Weather Services	

Hydrologic Services Program Management

2.7 River Forecast Centers	7
2.8 Weather Forecast Offices	8
3. Special Hydrometeorological Relationships and Interdisciplinary Programs	8
3.1 WFO/RFC/NCEP Operational Relationship	8
3.2 Advanced Hydrologic Prediction Service	9
3.3 Flash Flood Program	9

1. Introduction. National Weather Service (NWS) Policy Directive 10-9 provides the high-level policies for the Hydrologic Services Program. This instruction implements NWS Policy Directive 10-9 by providing a more detailed description of headquarters and field office activities required to support and carry out operations of the Hydrologic Services Program.

2. Hydrologic Services Program Activities. The Hydrologic Services Program is managed in accordance with Department of Commerce (DOC), National Oceanic and Atmospheric Administration (NOAA), and NWS policies. The Assistant Administrator for Weather Services has final management authority over the Hydrologic Services Program. Under oversight of the Assistant Administrator, several organizational units are responsible for aspects of the Hydrologic Services Program as identified in the following sections. Mission statements for these organizational units are provided in the NOAA Organizational Handbook.

2.1 Office of Climate, Water, and Weather Services. The Office of Climate, Water, and Weather Services (OCWWS) is responsible for a wide variety of activities which support the NWS Hydrologic Services Program. OCWWS accomplishes these responsibilities through functions of its divisions as described in the following sections.

2.1.1 Hydrologic Services Division. In coordination with NWS regions, the OCWWS Hydrologic Services Division (HSD, a.k.a. national HSD) manages NWS hydrologic warning and services programs through the following activities:

- a. Outreach - conduct and participate in national-level outreach activities with customers and partners. This includes coordinating issues and activities related to hydrologic services with NWS headquarters offices, Congressional offices, government agencies, and other customers and partners.
- b. Service requirements - compile and evaluate requirements received through national-level outreach activities and integrate them into national policies, plans, and requirements specifications.
- c. Field office requirements - using input received through the regional HSDs and others, provide requirements for hydrologic software systems to the Office of Hydrologic Development. They also provide appropriate developmental and management entities with requirements for computational hardware, communications, staffing, facilities, and observing systems needed by the Hydrologic Services Program.
- d. Service and operations policy - develop and maintain hydrologic service and operations policy through the National Directives System and other mechanisms.
- e. Service and operations planning - develop strategic plans for the enhancement and evolution of NWS hydrologic services and operations.
- f. Hydrologic systems support services - provide on-call support services for hydro-meteorological forecast systems used in river forecast centers (RFC) and weather forecast offices (WFO).
- g. Hydrologic data network services - work with other NWS entities and partners to maintain and expand the data network required for hydrologic forecast and warning services. This includes leading the Integrated Flood Observing and Warning System (IFLOWS) program.
- h. Training - Assimilate hydrologic training requirements of field office personnel and ensure development of needed national training. Also assist in the provision of hydrologic services-related training for field office personnel.
- i. Hydrologic remote sensing - provide remotely-sensed hydrologic data products used by WFOs, RFCs, National Centers for Environmental Prediction (NCEP),

and other customers and partners through the National Operational Hydrologic Remote Sensing Center (NOHRSC).

- j. National hydrologic information - provide information on national hydrologic conditions through the Hydrologic Information Center.

2.1.2 Meteorological Services Division. The Meteorological Services Division supports the Hydrologic Services Program by managing NWS weather warning and services programs, serving as the primary link between the NWS and weather-sensitive industries, and developing the plans, policies, and procedures for operations and services which provide weather forecast information used in hydrologic forecast and warning operations.

2.1.3 Climate Services Division. The Climate Services Division supports the Hydrologic Services Program by developing the plans, policies, and procedures for climate and long-term weather forecasting services. They also oversee long-term forecast services which incorporate hydrologic information such as drought outlooks.

2.1.4 Performance and Awareness Division. The Performance and Awareness Division supports the Hydrologic Services Program by supporting the verification process for river forecasts, quantitative precipitation forecasts (QPF), and flood/flash flood warning products. The Performance and Awareness Division manages the National Precipitation Verification Unit, which is responsible for verification of national QPF products. The division also supports hazard awareness activities for extreme hydrologic events and manages the service assessment process undertaken after events causing substantial loss of life and/or property such as regional floods.

2.1.5 Training Division. The Training Division supports the Hydrologic Services Program by overseeing the annual process of allocating training resources for hydrologic science, operations, and services. The Training Division also manages NWS personnel in training centers who provide training in hydrologic/hydrometeorologic subject areas.

2.1.6 Observing Systems Division. The Observing Systems Division supports the Hydrologic Services Program by maintaining plans, policies, procedures, and standards for NWS surface and upper air observing services. Many of these observing systems provide data used in hydrologic operations and services.

2.1.7 Operations and Requirements Division. The Operations and Requirements Division supports the Hydrologic Services Program by facilitating the processing of a subset of requirements received by national HSD – specifically those pertaining to the basic NWS systems infrastructure.

2.2 Office of Hydrologic Development. The Office of Hydrologic Development (OHD) supports the Hydrologic Services Program by developing and maintaining hydrologic/hydrometeorologic models, systems, and procedures in response to requirements provided by the national HSD. OHD maintains the operational system used to provide operational data to NWS field offices – the Hydrometeorological Automated Data System (HADS). In collaboration with outside research institutions, cooperating agencies, RFCs, WFOs, and NCEP, OHD conducts

applied research activities needed to infuse new hydrologic science into the operational hydrologic systems at field offices. OHD roles and responsibilities are described in the Science and Technology functional area (80) of the National Directives System.

2.3 Office of Science and Technology. The Office of Science and Technology (OST) has overall responsibility for plans, programs, and development in NWS science and technology activities. OST plans and develops systems providing observed and forecast information used in hydrologic operations. The Meteorological Development Lab within OST supports the Model Output Statistics (MOS) software, which provides temperature forecast guidance used as input to RFC hydrologic models. OST also supports the Hydrologic Services Program by ensuring that operational hydrologic technologies and applications developed by the OHD are integrated into NWS systems and by addressing requirements for system upgrades to accommodate hydrologic needs.

2.4 Office of Operational Systems. The Office of Operational Systems (OOS) is responsible for managing NWS operational systems. OOS supports the Hydrologic Services Program by managing NWS observing, forecasting, and dissemination systems required to conduct hydrologic operations and provide services. OOS also manages the acquisition of large-scale systems which host operational hydrologic forecasting systems.

2.5 Regional Headquarters. Each regional headquarters manages a regional hydrology program. The regional director is the first-line supervisor of RFC hydrologists in charge (HIC) as well as WFO meteorologists in charge (MIC) and, therefore, has a direct role in managing hydrologic activities at field offices.

2.5.1 Hydrologic Services. Five regions have a division or branch responsible for overseeing hydrologic services within the region – i.e., hydrologic services division, hydrologic and climate services division, or hydrologic services branch within a climate, water, and weather division. These are generically referred to herein as regional hydrologic services divisions (regional HSD). Pacific Region receives hydrologic support from the Alaska Region. The chief of the regional HSD serves as the manager and technical leader for the regional hydrology program. The following management and support responsibilities are delegated to the regional HSD:

- a. Oversight of hydrologic service delivery - monitor and assess the practices, local policies, and technical merit of the hydrology program at each RFC and WFO in the region. This includes support for service hydrologist program leadership activities.
- b. Forecast improvement - direct and support improvements to RFC and WFO hydrologic modeling and forecast operations. This includes supporting hydro-meteorological operations such as those for QPF and flash flood and overseeing routine WFO/RFC interactions and longer-term collaborative activities.
- c. Training - facilitate training activities specific to local field office requirements and hydro-climatologies in the region.

- d. Policy/procedure implementation - develop supplements to national directives for the Hydrologic Services Program. Ensure WFO and RFC compliance with regional directions on hydrologic/hydrometeorologic operations and services provided in supplements as well as all applicable national directives.
- e. Service and operations planning - develop strategic plans for hydrologic service improvements within the region.
- f. Outreach - represent NWS, NOAA, and DOC in regional intra-agency, inter-agency, and river basin commission activities. Receive and assimilate service requirements from customers and partners in the region.
- g. National requirements - assimilate hydrologic systems and services requirements from WFOs and RFCs and provide them to national HSD as per the established hydrologic requirements process. Coordinate regional data requirements and resolve hydrologic/hydrometeorologic data problems affecting hydrologic operations in the region's WFOs and RFCs.
- h. Regional requirements - work with WFOs and RFCs to establish regional requirements (e.g., for data, hardware, etc.) for provision of hydrologic services. Work with other regional divisions to meet these requirements.
- i. Information exchange - work with WFOs, RFCs, and other regional HSDs to facilitate the sharing and exchange of information, procedures, process, software, and related items between field offices and regions.
- j. National headquarters interactions - represent Hydrologic Services Program concerns of the regional director and field offices to the NWS headquarters and provide regional input to plans, proposals, training, and other products developed by NWS headquarters.
- k. Service assessment - provide assessments of field office performance during significant hydrologic events to the regional director and/or NOAA/NWS management as appropriate.
- l. Data program oversight - some regional HSDs provide oversight of the NWS data collection program, including the Cooperative Observer Network.

2.5.2 Scientific Services. Scientific services divisions support hydrologic/hydrometeorologic training and professional development at the regional and national levels.

2.5.3 Meteorological Services. Meteorological service (or climate, water, and weather) divisions support hydrometeorological science and operations activities, some of which lead to improvements in flash flood and precipitation forecasting. In some regions, this division oversees the flash flood warning and verification programs.

2.5.4 Systems Operations. The systems operations division support hydrometeorological services and operations by overseeing maintenance and upgrades to the WFO and RFC operational systems, and in some regions, by providing maintenance oversight of NWS data collection programs, including the Cooperative Observer Network.

2.6 National Centers for Environmental Prediction. The NCEP collects global meteorological data and uses it to generate a wide variety of environmental guidance information. Individual national centers support the Hydrologic Services Program through activities briefly summarized as follows:

- a. NCEP Central Operations executes the numerical analysis and atmospheric forecast models and ensembles of models used in everyday hydrometeorological analysis at RFCs and WFOs.
- b. The Hydrometeorological Prediction Center (HPC) produces the forecaster-developed QPF and probabilistic QPF (PQPF) products for all types of weather systems, including tropical systems. These QPF products are used as guidance by RFC forecasters, and after possible editing to account for local hydrometeorological conditions, serve as input to RFC models. The HPC provides gridded QPFs to WFOs, which serve a starting point for production of QPFs for local use. The HPC also produces other products which assimilate hydrometeorological information on a national basis, including a flood outlook product and a flash flood hazards product.
- c. The Environmental Modeling Center develops, maintains, and improves the atmospheric models which produce the graphical and numerical output (e.g., forecast precipitation and temperature) used in short- and medium-term AHPS products.
- d. The Climate Prediction Center provides products quantifying how precipitation and temperature is expected to deviate from climatic averages through the long-term forecast period.
- e. The Storm Prediction Center produces event-based, short-term rainfall rate forecasts.
- f. The Tropical Prediction Center provides official NWS forecasts for the movement and strength of tropical weather systems.

2.7 River Forecast Centers. Each RFC conducts continuous hydrologic modeling of river basins, provides hydrologic forecasts and guidance, and carries out liaison activities with partners. RFCs assimilate hydrologic/hydrometeorologic data and forecasts from multiple sources including the NCEP, WFOs, and other partners, and use this information in real-time hydrologic modeling and forecast operations. Each RFC provides a range of hydrologic forecast and guidance products for one or more major river basins to WFOs and selected water agencies.

Each RFC supports multiple WFOs. RFC operations are described in NWS Instruction 10-911 and RFC products and services are described in NWS Instruction 10-912.

2.8 Weather Forecast Offices. Each WFO provides hydrologic forecasts, warnings, and related products to customers and partners for its local area of responsibility. As part of an integrated mode of operations, the entire WFO operational staff participates in hydrologic activities, including issuing routine hydrologic products and collecting and quality controlling the hydrologic/hydrometeorologic data. WFO hydrologic operations are described in NWS Instruction 10-921 and WFO hydrologic products and services are described in NWS Instruction 10-922.

3. Special Hydrometeorological Relationships and Interdisciplinary Programs. The special hydrometeorological relationships and interdisciplinary programs described in this section need the support of all managers participating in the Hydrologic Services Program.

3.1 WFO/RFC/NCEP Operational Relationship. Managers at WFOs, RFCs, and the NCEP should encourage operational interactions between their operational staffs while recognizing the uniqueness of each entities' operations. Hydrologic modeling and hydrometeorologic data technologies developed by the OHD are vital in supporting these interactions. The goals of these interactions are to further the NWS mission by: (1) integrating interrelated aspects of hydrologic and meteorologic science into WFO, RFC, and NCEP operations; (2) encouraging hydrometeorological collaboration activities between WFOs, RFCs, NCEP, and the OHD; and (3) supporting integrated operations, where appropriate, within field offices.

WFOs, RFCs, NCEP, and OHD should collaborate in the development of hydrometeorological applications such as flash flood models, precipitation processing algorithms, and QPF techniques. They should maximize the routine sharing of support, data, forecasts, and other information and collaborate in the development of procedures to enhance such exchanges.

NWS hydrologic forecasts on the short-term (out to 7 days), medium-term (7 out to 14 days), and long-term (2 weeks out to 3 months or more) time scales are heavily dependent on the effective coupling of hydrologic and meteorologic observations and forecast information from WFOs, RFCs, and NCEP. Quantitative precipitation estimates (QPE) from radar, satellite, and ground-based observations; snowpack information; QPF; temperature forecasts; and forecasts for other hydrometeorological variables serve as critical input to the hydrologic modeling process for all time scales. Extended-range meteorologic forecasts and predictions from global climate models are important input to long-term hydrologic forecasts.

The operational coupling of hydrologic and meteorologic observations and forecasts for all time scales requires effective real-time coordination between the RFCs, WFOs, and NCEP. The RFC hydrometeorological analysis and support (HAS) function is the catalyst for this coordination. However, RFC, WFO, and NCEP managers should ensure this coordination occurs through a team effort of their entire staffs. Key hydrometeorological coordination activities of these three partners can be summarized as follows:

- a. NCEP - provision of discussions and related products on current/forecast meteorological conditions and hosting of coordination conference calls during significant weather events.
- b. RFCs - production of discussions on current/forecast hydrologic conditions and notification of WFO and NCEP forecasters of important changes in current or forecast streamflow conditions. RFC coordination activities also include supporting WFO site-specific hydrologic modeling operations and providing technical expertise on hydrologic events and other water-related issues.
- c. WFOs - notification to RFCs when changing hydrometeorological conditions or special observations indicate the need for updated hydrologic forecasts and when data quality problems have been identified at specific gage locations.

Other joint coordination activities between these partners which managers should encourage include: pre-event conference calls, site visitations, joint training, workshops, collaborative research projects, flood drills, and collaborative preparation of long-term outlooks.

3.2 Advanced Hydrologic Prediction Service. Advanced Hydrologic Prediction Service (AHPS) is a national effort to provide enhanced hydrologic information and products through the infusion of new science and technology. The goal of AHPS is to improve flood warnings and water resource forecasts nationwide to meet the diverse and evolving needs of partners and customers. While it is a budget initiative with a defined life span and an accompanying set of goals, managers involved in the Hydrologic Services Program should address AHPS as an effort to modernize and energize all aspects of hydrologic services provided to customers and partners.

The AHPS program is managed by the Office of Hydrologic Development. The AHPS Program Manager in OHD conducts planning, administers the budget, and guides and tracks implementation for the program. National HSD assimilates service, science, and operational requirements for AHPS originating from the NWS field offices and provides prioritized requirements to OHD. National HSD also develops general operations concepts for AHPS as well as other plans for specific AHPS components. Program planning, oversight, and resource allocation for AHPS is provided by the AHPS Review Committee (ARC). The ARC is comprised of representatives from the regional HSDs as well as OCWWS, OHD, OST, and NCEP.

3.3 Flash Flood Program. The NWS Flash Flood Program was originally implemented in 1970. According to Operations Manual Letter 74-8, *Management of the Flash Flood Program*, dated March 21, 1974, the program was implemented “to provide a flood warning service when timely stage forecasts cannot be provided by river forecast centers.” This led to a program based largely on watch/warning products for areas (e.g., counties), issued by weather offices and supported by areal RFC products known as flash flood guidance. Because heavy precipitation from convective weather systems is the primary cause of flash floods, and watches and warnings are most often handled on an areal basis like other weather events, a meteorological perspective has historically prevailed in the Flash Flood Program.

Collaborative efforts to improve flash flood guidance, QPF, and QPE have led to more timely areal flash flood products. However, forecasting technologies which improve the site-specificity and information content of warning products will allow flash flooding to be increasingly addressed from a hydrologic perspective. These technologies include:

- a. The Flash Flood Monitoring and Prediction (FFMP) function, which provides the ability to pinpoint individual basins threatened by flash flooding.
- b. The Site-Specific Hydrologic Prediction (SSHP) function, which allows products to include stage/flow forecasts for specific locations in small stream basins.
- c. Distributed rainfall-runoff models, which allow hydrologic processes to be more realistically simulated in stream basins of all sizes.

National headquarters, regional headquarters, and field offices should account for the increasing role of hydrologic science, technology, and services in determining the support infrastructure for the Flash Flood Program.
